MEMORANDUM FOR RECORD

REFERENCE: Letter from [ ] Program Coordinator,  
Functional Photography, [ ] dated 3 September  
1965 - Project No. 997296

1. The reference had, as enclosures, samples of the [ ] Dry Process Film which had been heat-processed by two different methods. One set of three samples had been processed on a hot "mangle" roller, the other set of three samples had been processed on a heated silicone rubber belt. The samples in each set represent three combinations of film velocity and processing temperature.

2. On 14 September the undersigned gave the two sets of samples to [ ] IAD/CIA for evaluation, by P.I.'s, of surface deformation due to contact with the heated roller or belt. The samples were returned on 16 September with a note to the effect that while both sets were acceptable, the material processed on the heated belt was preferred to that processed by the "mangle" rollers.

3. The undersigned telephoned [ ] on 17 September and informed him that we preferred the results of the heated belt. During this telephone call [ ] volunteered to send [ ] to discuss specifications for a field type of printer-processor. [ ] is working on our Dry Process and Printer-Processor contracts [ ]. A better plan might be to take a P.I. to [ ] where a mock-up and existing equipment would be available for demonstration. Any time spent on this project would divert [ ] from the existing contracts.
